To Whom It May Concern,

Pharmaxis is a pharmaceutical company producing inhalation products for cystic fibrosis and asthma. The company has been operational for 10 years and utilises the Uhlmann B1240 blister packer to package the different products into Alu-Alu blisters.

From the start, the machine has operated reliably. Instrumentation on the machine includes a pinhole detector, automatic capsule feeder and camera detection unit to provide confidence in the packaging of the product. Commissioning and validation work was conducted seamlessly through the supply of accurate documentation and experience of the Uhlmann service engineers. Production documents for format setup, maintenance and spare parts procedures and checklists were published with reference to the comprehensive documentation supplied by Uhlmann and the machine understanding of Alan Melliger of MPI.

Advice and assistance in troubleshooting was, and still continues, to be provided effectively by Alan, who has a wealth of experience and knowledge concerning the build and operation of the Uhlmann machine.

Pharmaxis has found both MPI and Uhlmann very responsive companies to work with. This together with the mechanically sound machine design means I have no hesitation in recommending both companies to anyone who is considering utilising their services or products.

Please feel free to contact me if you wish to discuss any aspects of the goods and services provided by either Uhlmann or MPI.

Yours Sincerely,

Ken Gock
Engineering Projects Manager
